

Agroclim Unit Service

The unit's mission is to make data (raw or processed) available to the scientific community of Inra researchers and tools to relate weather data to agro-environmental data.

The unit's work is structured around 4 missions:

- management and maintenance of Inra's national weather recording network,
- development of weather and weather-dependent databases and making these data available to the scientific community,
- development and use of crop models such as STICS to predict and evaluate the effect of climate on agriculture,
- studying and acquiring expertise on the relationships between agriculture and climate change.
