

Ecodevelopment

The central theme of the research conducted concerns the relations between agricultural activities and environmental actions in the biodiversity protection and management at the international, national and local scales.

Research activity is focused on:

- the evolution of public policies characterised by the incorporation of environmental objectives in sectoral policies (agricultural and territorial spheres),
- (more) environment-friendly production models (integration and organic farming, neo-pastoralism),
- the development of tools to accompany changes in agriculture.

In addition to academic results, research is aimed at:

- helping rural stakeholders to better design the changes needed in measures stemming from agricultural and environmental policies,
- designing accompaniment and partnership approaches.
